# Scepter   Sideloading an APP

| 1 |
|---|

Download the APK file for the app you are wanting to install onto your PC.
*Note: in most cases you can download the APK directly from the software provider's site.  There are also several APK download sites that make these APKs available.  For example, www.apkmirror.com and www.apkpure.com.*

| 2 |
|---|

Place the Scepter in the charging cradle (connected via USB to PC) and enable **File transfer** mode:

- Swipe downward from top of screen.
- Tap **USB for charging**… then **File transfers.**

Open *Windows File Explorer* on the PC.

 (*note: this can also be performed using a thumb drive inserted into the charging cradle)

Copy your apk file(s) to: **Scepter > Internal storage > Download.**

Install the APK on the Scepter using the *File Manager* app:

- Tap the *File Manager* app to open
- Navigate to the **Download** folder

Tap on the APK file and choose **Install.**

*Note:  Once you have a unit configured the way you want it, the AML Clone app will allow you to make a clone file for your device (which will copy/clone all settings, applications, files. etc.) to be deployed onto your other devices.  The AML Clone app is not just a backup and restore function, but a true cloning utility.  The encrypted clone file can then be used to quickly image other devices with all the same applications, settings and credentials.  See *AML Cloning App* document.*
